                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway

Claim 11; Page 142-143; 157pp; English.

present. The bacterial strain of the invention can be used as a denitrifying agent for the conversion of nitrate or nitrite to nitrous oxide with methane or methanol as a carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide variety of pigments (particularly for isoprenoid pigments for the purpose of generating animal feeds), in production of terpenoid and carotenoid compounds, useful as pigments and as monomers in polymeric materials and in production of texpolysaccharides at high levels. Sequences ABG61551-ABG61590 represent high growth methanotrophic bacterial strain proteins of the invention. NA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, e.g. ammonia, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a pigment and for reducing oxygen demand, for removing nitrates and nitrites in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are The invention relates to a high growth methanotrophic bacterial strain, which grows on a C1 carbon substrate e.g. methans and methanol, and comprises a functional Embden-Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutokinase enzyme or a 16 RNA. The bacterial strain is useful for the production of single cell 168 the

Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon

Claim 45; Page 118-119; 156pp; English.

encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which methoblise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas 16a sp. 2C-methyl-d-erythritol 2,4-cyclodiphosphate The method comprises a transformed metabolising carotenoid compounds. suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway "man openate on trol of regulatory possessions of the carotenoid biosynthetic pathway "man openate on trol of regulatory possessions of the carotenoid biosynthetic pathway "man openate on trol of regulatory possessions of the carotenoid biosynthetic pathway "man openate of the caroten synthase (IspF) enzyme used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for producing recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 5 (ORFS) ygbB/igpF (2C-methyl-d-crythritol) 2.4-cyclodiphosphate synthase enzyme) protein of the invention, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cheng Q, Ku

The invention is useful for obtaining a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-PSDB; ABK50085

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used to identify compounds that bind to the gene products, particularly in affinity selection assays. (II) and (IIa) are used to identify, or prepare, antibodies and other proteins that bind to the gene products. Substances that bind to (II) or (IIa) are potentially useful as entibacterials for treating a wide range of infections in humans and animals. Sequences antisense to (I) and (Ia) can also be used as antibacterials. The specified genes are widely distributed in bacteria but have no close homologs in eukaryotic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel Escherichia coli genes (I) encoding proteins (II) designated YQGF, YHBC, YGGJ, YGBP, YCHB, YGBB, YUBB and YDTB, and genes (Ia) that encode orthologous gene products (IIa) in other microorganisms and which have antibacterial activity. Recombinant microorganisms in which expression of (I) or (Ia) can be regulated activity and the microorganisms in which expression of (I) or (Ia) can be regulated activity.
                                                                               19-0CT-2000

                                                                                                                                                                                                                                                         2-C-methyl-D-erythrytol-2,4-cyclodiphosphate synthetase; non-mevalonate pathway; 2-C-methyl-D-erythrytol-2,4-cyclodiphosphate; 2-phospho-4-(cytidine 5'-diphospho) 2-C-methyl-D-erythrytol; CDP-ME2P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying antibacterial compounds, comprises identifying antagonist or inhibitor of the expression of a gene encoding polypeptide essential for bacterial growth or survival -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a 2-C-methyl-D-erythrycol-2,4-cyclodiphosphate synthetase. The enzyme is involved in the non-mevalonate pathway. It acts on 2-phospho-4-(cytidine 5'-diphospho) 2-C-methyl-D-erythrytol (CDP-ME2P). to produce 2-C-methyl-D-erythrytol-2,4-cyclodiphosphate and cytidine 5'-monophosphate. The enzyme has a molecular weight of 22 kDa, as determined by sodium dodecyl sulfate polyacrylamide gel electrophoresis. The enzyme or gene can be used to increase isoprenoid compound

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a crystal comprising 2C-methyl-p-erythritol 2,4-cyclodiphosphate synthase with or without zinc. The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibiotics against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is 2C-methyl-p-erythritol 2,4-cyclodiphosphate synthase from Escherichia coli, encoded by the ispF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.

```

The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including 5. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonist and inhibitors which can be used in disease treatment and pesticides.

 identified inhibitors are useful as antibiotics against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, as herbicides. The inhibitors are also useful for inhibiting the
                                  The present invention relates to a crystal comprising 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase with or without zinc. The crystal is useful in an inhibitor-screening assay, and
                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein co-ordinate data; herbicide; protozoacide; antibacterial; antibiotic; isoprenoid synthesis; crystal; enzyme; 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase; malaria; Plasmodium falciparum; ispF; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.
                                                                                  Example 2; Page -; 214pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   synthesis of isoprenoids. The present sequence is a mutant of 2C-methyl-D-crythritol 2,4-cyclodiphosphate synthase which was ger in an example from the invention.

Note: The present sequence is not shown in the specification, but derived from the wild-type sequence of Escherichia coli 2C-methyl-D-crythritol 2,4-cyclodiphosphate synthase (ABP70685).
                                                               Novel crystal useful for identifying a potential inhibitor 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase, compr 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The present sequence is not shown in the specification, but derived from the wild-type sequence of Escherichia coli 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase (ABP70685).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      zinc. The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibicines against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is a mutant of 2C-methyl-p-erythritol 2.4-cyclodiphosphate synthase which was generated in an example from the invention.
                                                                                                        Bacher A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a crystal comprising 2C-methyl-D-crythritol 2,4-cyclodiphosphate synthase with or without zinc. The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibiorics against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is a mutant of 2C-methyl-D-crythritol 2,4-cyclodiphosphate synthase which was generated in an example from the invention.

Note: The present sequence is not shown in the specification, but is carived from the wild-type sequence of Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                            Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABG75686 standard; Protein;

The invention relates to a 2C-methyl-D-erythritol 2,4-cyclodiphosphate CC synthase (MSCPS) protein, or a functional MECPS protein subunit, in CC crystalline form. The invention also relates to a computer readable database comprising representation of a compound capable of binding a CC binding pocket of an MECPS protein. The methods are useful for producing CC a compound comprising a 3D molecular structure represented by the CC coordinates contained in a computer readable database, modulating MECPS protein activity by contacting the MECPS with a compound, identifying an activator or inhibitor of a protein that comprises an MECPS active site or binding pocket, producing a mutant MECPS protein having an altered CC or binding pocket, producing a mutant MECPS protein having an altered CC property relative to an MECPS protein and determining whether a compound CC binds the MECPS protein. The protein is useful for identifying and CC designing inhibitors and activators of MECPS, for designing and compound CC designing inhibitors and activators of mechanisms activity in an associated biochemical, metabolic or anabolic pathway, or for rational CC drug design to identify and/or design compounds that bind MECPS for corretain of the invention agents. This sequence represents the MECPS in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Also disclosed are the nucleic acid molecules encoding the proteins an antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP/6736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                              Identifying an antigen for manufacturing a vaccine against meningococcal infection, comprises contacting antibodies with polypeptides, detecting polypeptide-antibody complexes, and it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine; antigen;

```
cc (a) obtaining antibodies against a commensal bacteria, or an extract (c) from a commensal bacteria; (b) contacting the antibodies with completides obtained from an expression library of either a commensal or c polypeptides obtained from an expression library of either a commensal or c antibodies; and (d) (where a polypeptide binds to an antibody) cidentifying that polypeptide as an antigen. Also included are: (c) a method of preparing a vaccine composition, comprising identifying can antigen with the above method, and combining the antigen with a c carrier; (2) a vaccine composition obtained by the above methods; (c) an antigen identified by the above methods; (d) a polypeptide composition obtained by the above methods; (d) a natigen identified by the above methods; (d) a polypeptide composition of a nucleic acid sequence comprising the c preparing a composition for vaccination against infection by pathogenic consistency; (d) a vector comprising the nucleic acid molecula; (d) a method of c preparing a composition for vaccination against infection by pathogenic consistency; (d) comparing the sequence of the second antigen from a pathogenic consistency; (d) comparing the sequence of the first antigen with the sequence of the nucleic acid which codes for the consistency; (d) an enthod of c patteria, or comparing the sequence of the nucleic acid which codes for the second antigen, and (f) preparing a composition c protein antigen; and (f) preparing a composition c for vaccination against bacterial infection comprising the first antigen; and (f) an antibody that binds to the polypeptide antigen; the first antigen; c and (f) an antibody that binds to sera raised against commensal commensal and pathogenic bacterial proteins. The polypeptide is useful as a vaccine antigen to composition c polypeptide antigen that binds to sera raised against commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commensal commens
